

AI Overview

Using Flowbite's unbundled or modular JavaScript allows you to import specific components (like modals, dropdowns, or tooltips) instead of the entire bundled library. This is especially useful for reducing bundle size, avoiding global pollution, or preventing conflicts with your frontend framework. [Flowbite +4](#)

How to use Unbundled Flowbite

To use Flowbite in an unbundled or modular way, you can import specific component classes and their associated types directly from the `flowbite` package's ES modules. [Flowbite +1](#)

1. Installation

Install the core Flowbite library using npm or yarn:

bash

npm install flowbite

Use code with caution.

2. Import Specific Components

Instead of using the default `import 'flowbite'` (which bundles all components and automatically initializes them for HTML data attributes), import only what you need and initialize them using JavaScript. [Flowbite +1](#)

javascript

import { Modal, Dropdown } from 'flowbite';

// Example: Target your existing DOM elements

const \$modalElement = document.querySelector('#my-modal');

const \$triggerButton = document.querySelector('#trigger-button');

// Create a new modal instance

const modal = new Modal(\$modalElement);

// Bind custom events

\$triggerButton.addEventListener('click', () => {

modal.toggle();

});

Use code with caution.

3. Component Initialization

If you prefer to manually initialize components without assigning them to variables, you can use the respective `init` functions provided by the library: jsDelivr

```
javascript

import { initModals, initDropdowns } from 'flowbite';

// Initialize all modals in your DOM
initModals();

// Initialize all dropdowns
initDropdowns();
```

Use code with caution.

4. Configure Tailwind CSS

Ensure that Flowbite's plugin is included in your `tailwind.config.js` and that Tailwind scans the `node_modules` directory:

```
javascript

module.exports = {
  content: [
    './src/**/*.html',
    './node_modules/flowbite/**/*.js'
  ],
  plugins: [
    require('flowbite/plugin')
  ],
}
```

Use code with caution.

For advanced use cases like customizing classes or type-checking with TypeScript, refer to the official [Flowbite JavaScript API](#) for the exact methods and parameters available for each UI component.
